**Course Information Sheet**

**CSCI 4150**
Numerical Simulations in Science and Engineering

### Brief Course Description
(50-words or less)

Computationally oriented, covering a wide range of topics that are necessary for numerical simulation in science and engineering. Sequential and parallel numerical methods will be introduced. Available symbolic and numerical software packages (e.g., Matlab, Maple and MPI) and visualization tools will be used in the mathematical simulations.

### Extended Course Description / Comments

Course in calculus and/or knowledge of a programming language

### Pre-Requisites and/or Co-Requisites

- Course in calculus and/or knowledge of a programming language

### Approved Textbooks
(if more than one listed, the textbook used is up to the instructor’s discretion)

- Author(s): My own notes
- Title: 
- Edition: 
- ISBN-13:

### Specific Learning Outcomes
(Performance Indicators)

These are a (non-exhaustive) list of specific, measurable outcomes, as they relate to course and program objectives.

This course presents topics in numerical methods for students studying computer science and/or engineering. At the end of the semester, all students will be able to do the following:

1. Use Taylor series and symbolic available software to find finite difference formulas for one and higher order derivatives.
2. Discretize ordinary differential equations (ODEs) by finite difference Methods and solve them.
3. Distinguish between explicit and implicit methods for solving ODEs.
4. Use Fourier transform to solve simple ODEs and PDEs.
5. Use Galerkin finite element method for solving two point boundary value problem.
6. Differentiate between different classifications of computer systems.
7. Map a problem on different high performance systems.
9. Use visualization tools to study the results and draw a conclusion on the solution.

### Relationship Between Student Outcomes and Learning Outcomes

Student Outcomes

a. An ability to apply knowledge of computing and mathematics appropriate to the discipline.

b. An ability to analyze a problem, and identify and define the computing requirements appropriate to its solution.

c. An ability to design, implement, and evaluate a computer-based system, process, component, or program to meet desired needs.

d. An ability to function effectively on teams to accomplish a common goal.

e. An understanding of professional, ethical, legal, security and social issues and responsibilities.

f. An ability to communicate effectively with a range of audiences.

g. An ability to analyze the local and global impact of computing on individuals, organizations, and society.

h. Recognition of the need for and an ability to engage in continuing professional development.

i. An ability to use current techniques, skills, and tools necessary for computing practice.

j. An ability to apply mathematical foundations, algorithmic principles, and computer science theory in the modeling and design of computer-based systems in a way that demonstrates comprehension of the tradeoffs involved in design choices.

k. An ability to apply design and development principles in the construction of software systems of varying complexity.

Major Topics Covered

(Approximate Course Hours)

3 credit hours = 37.5 contact hours
4 credit hours = 50 contact hours

Note: Exams count as a major topic covered

1. Introduction to scientific computing and numerical (3 hours) simulations
2. Finite difference methods (5 hours)
3. Introduction to finite element methods (5 hours)
4. Finite Fourier methods (4 hours)
5. Symbolic computation (3 hours)
6. Introduction to higher performance computing (4 hours)
7. Classification of computer systems (3 hours)
8. Speedup and efficiency (2 hours)
9. Visualization tool (3 hours)
10. Mathematical models and implementation (12 hours)
10. Exams (6 hours)

A number of mathematical models for problems in science and engineering will be discussed and numerical solutions for them will be implemented. Available symbolic and numerical computational packages (such as Matlab, Maple and MPI) and visualization tools will be used in the simulations.

Assessment Plan for this Course

Each time this course is offered, the class is initially informed of the Course Outcomes listed in this document, and they are included in the syllabus. At the end of the semester, an anonymous survey is administered to the class where each student is asked to rate how well the outcome was achieved. The choices provided use a 5-point Likert scale containing the following options: Strongly agree, Agree, Neither agree or disagree, disagree, and strongly disagree. The results of the
anonymous survey are tabulated and results returned to the instructor of the course.

The course instructor takes the results of the survey, combined with sample student responses to homework and final exam questions corresponding to course outcomes, and reports these results to the ABET committee. If necessary, the instructor also writes a recommendation to the ABET committee for better achieving the course outcomes the next time the course is offered.

How Data is Used to Assess Program Outcomes

Each course Learning Outcome, listed above, directly supports one or more of the Student Outcomes, as is listed in "Relationships between Learning Outcomes and Student Outcomes". For CSCI 4150, Student Outcomes (a), (b), and (i) are supported.
